Chassis-as-a-Subscription

[THE MECHANICS:]

Framework introduces a decentralized compute lease model where users subscribe to a foundational chassis architecture -- containing the structural frame, display, battery, and input deck -- rather than purchasing a monolithic laptop. Users hot-swap internal computing nodes on demand while the physical alloy chassis is perpetually maintained by Framework. Subscribers pay a base tier for hardware-as-a-service, automatically receiving passive performance upgrades via upgraded mainboards shipped biannually.

Old mainboards and expansion cards are not discarded but automatically funneled back into Framework's reverse-logistics pipeline via prepaid return mailers embedded in the packaging. These returned components are automatically recertified, flashed with edge-compute or server-node firmware, and redeployed as enterprise micro-servers or educational desktop units at a lower subscription tier, maximizing the lifecycle margin of every silicon node produced.

[UTILITARIAN VALUE:]

This model transforms low-frequency, high-friction transactional hardware sales into a high-margin recurring revenue stream with near-zero churn, as the modular upgrade path eliminates obsolescence anxiety. By capturing the residual value of returned mainboards and repurposing them into secondary enterprise tiers, Framework extracts double-digit margin yields from hardware that would otherwise depreciate on secondary markets.

[TARGET ECOSYSTEM:]

Enterprise IT fleets and professional remote workforces requiring frictionless hardware lifecycle management and zero e-waste compliance.
