Synthetic Artifact Custody

[THE MECHANICS:]

Integration of autonomous supply chain telemetry from logistics container tracking combined with finite-state game economy decay mechanics. Every physical vinyl figure ships embedded with an uncopiable NFC-enabled cryptographic tag that dictates the digital life cycle of its corresponding synthetic character (Janky or Guggimon). The physical toy must be periodically scanned via a mobile verification app within a designated geospatial radius to prevent simulated "stasis decay" in the digital realm. If a collector leaves the physical artifact dormant in a dark shelf for more than ninety consecutive days, the associated virtual avatar's algorithmic autonomy, voting rights in upcoming streetwear drops, and access to private digital spaces degrade in real time, forcing collectors to actively curate and display their physical inventory to maintain digital asset utility.

[UTILITARIAN VALUE:]

This mechanism creates an indestructible moat against speculative hoarding and dead inventory while driving an unprecedented frequency of app engagement. By forcing physical interaction to preserve digital status, Superplastic transforms passive collectors into active custodians, drastically reducing secondary market churn and generating high-margin SaaS-like engagement metrics from static vinyl sales. Furthermore, verified physical-digital linkage unlocks tier-one programmatic ad-network revenue and luxury brand partnership metrics previously inaccessible to toy manufacturers.

[TARGET ECOSYSTEM:]

High-net-worth urban collectors and digital-native streetwear enthusiasts participating in global, app-mediated release drops.
