The Phenological Archive Series

[THE MECHANICS:]

The Phenological Archive functions as a subscription-based, hyper-seasonal liquid ledger. Each release is a 200ml apothecary specimen bottle containing a spirit distilled from a single, hyper-local botanical harvest window -- specifically timed to the 48-hour peak of a forest event, such as the emergence of wild ramps or the bloom of late-autumn witch hazel. These spirits are processed via sub-atmospheric rotary evaporation at exactly 32 degrees Celsius to preserve volatile aromatic compounds that are destroyed by traditional heat distillation.

The physical hardware includes a custom-machined, serialized brass wax-seal stamp and a QR-embedded NFC tag integrated into the heavy-gauge glass stopper. Scanning the stopper triggers a digital twin interface that displays the atmospheric pressure, GPS coordinates of the forage site, and the specific vacuum-pressure curve used during that batch's distillation. This creates a closed-loop provenance system where the digital metadata is as immutable as the liquid composition.

[UTILITARIAN VALUE:]

This model converts ephemeral, low-yield foraging runs into high-margin "micro-drops" that bypass traditional distribution overhead. By positioning the product as an archival specimen rather than a consumable spirit, Tamworth can command a 400% price premium over standard retail offerings while driving recurring revenue through a scarcity-indexed membership tier that guarantees first-access to the most limited botanical windows.

[TARGET ECOSYSTEM:]

Ultra-premium craft spirits collectors and culinary technophiles participating in the direct-to-consumer apothecary market.
